July 2011

# Overview of Course

- Sequence Alignment; Multiple Sequence Alignment
- Sequence Analysis
- Sequencing
- Phylogenetic Analysis
- Gene prediction techniques
- Pattern discovery techniques
- Protein structure alignment and analysis
- Genomics, Functional Genomics, Proteomics
- Gene Expression Data Analysis
- RNA Secondary structure
- RNA interference and small RNA
- Databases & Software Packages
- Statistics for Bioinformatics
- Computational Learning & Predictive Methods
- Emerging Biotechnologies

# Software Packages

- ❑ Databases (*GenBank, SwissPROT*)
- ❑ Programming Environments (*BioPerl*)
- ❑ Sequence Alignment (*BLAST, CLUSTALW*)
- ❑ Phylogenetic Analysis (*CLUSTALW*)
- ❑ Learning Methods (*HMMer*)
- ❑ Pattern Discovery Techniques (*GYM, TEIRESIAS*)
- ❑ Molecular Structure Analysis (*DALI, RASMOL, SPDBV*)
- ❑ Microarray Analysis (*CLUSTER, GeneCluster, TreeView*)
- ❑ Statistical Software Packages (*SAS, R*)

# Genomic Databases

- **Entrez Portal** at National Center for Biotechnology Information (**NCBI**) gives access to:
  - Nucleotide (**GenBank**, **EMBL**, **DDBJ**)
  - Protein (**PIR**, **SwissPROT**, **PRF**, and Protein Data Bank or **PDB**)
  - Genome
  - Structure
  - 3D Domains
  - Conserved Domains
  - Gene; UniGene; HomoloGene; SNP
  - GEO Profiles & Datasets
  - Cancer Chromosomes
  - PubMed Central; Journals; Books
  - OMIM
  - Database Neighbors and Interlinking

# Evaluation

- |   |        |
|---|--------|
| <input type="checkbox"/> Homework Assignments | (35 %) |
| <input type="checkbox"/> Exam                 | (35 %) |
| <input type="checkbox"/> Semester Project     | (25 %) |
| <input type="checkbox"/> Class Participation  | (5 %)  |

# Course Homepage

[http://www.cis.fiu.edu/~giri/teach/BSC4934\\_Su11.html](http://www.cis.fiu.edu/~giri/teach/BSC4934_Su11.html)

- Lecture notes, required reading material, homework, announcements, etc.*

# History

- ❑ What major discovery was made in 1953?
- ❑ What major world event took place on 26 June, 2000?
- ❑ 1975: Sanger Sequencing
- ❑ 1977: first bacteriophage sequenced
- ❑ 1990: HGP initiated

# Introduction

## 1. What is Bioinformatics?

- Analysis of biological data with computing & statistical tools.

## 2. The different aspects of Informatics?

- Data Management (Database Technology, Internet Programming)
- Analysis/Interpretation of Data (Data Mining, Modeling, Statistical Tools)
- Development of Algorithms/ Data Structures
- Visualization and Interface Design (HCI, Graphics)

## 3. How to assist biological research?

- propose new models or correlations based on data from experiments
- verify a proposed model using known data
- propose new experiments based on model or analysis
- use predicted information to narrow down search in a biological investigation

# Overall Goals

# Perspective of Bioinformatics

- ❑ Study of the cell: DNA, genes, proteins
- ❑ Study of the organism: genome, changes over time, over body regions, or over physiological or pathological states
- ❑ Study of all life: Tree of Life, Phylogeny, Variations, comparative genomics

# General Information

- ❑ **GenBank** Release 163/178/184 (Dec 2007/Aug 2009/Jun 2011) contains over 80/108/140 million sequence entries totaling over 83/106/129 Gb from over 2,500/12,000/15,000 organisms [<http://www.ncbi.nlm.nih.gov>] (Storage: ~150/476/506 GB uncompressed)
- ❑ **Human Genome** has ~3 billion bp with 32,000+ genes.
- ❑ 1673 complete **bacterial** (112 **archaeal**) genomes sequenced
- ❑ 3872 **Viral** genomes (300bp - 300Kb) (1<sup>st</sup> 1978: Simian virus; 5Kb).
- ❑ **UniProtKB/Swiss-Prot** Release 54.7/2010\_06 (Jan'08/May'10): 333K/517K entries; 120/182 million amino acids.

# 41 Complete Eukaryotic Genomes

- Caenorhabditis elegans*
- Arabidopsis thaliana*
- Saccharomyces cerevisiae*
- Mus musculus*
- Homo sapiens*
- Oryza sativa*
- Plasmodium falciparum*
- Drosophila melanogaster*

# 434+731 Incomplete Eukaryotic Genomes

- Anopheles gambiae*
- Macaca mulatta*
- Bos taurus*
- Felis catus*
- Gallus gallus*
- Xenopus laevis*
- Ovis aries*
- Equus caballus*
- Lama pacos*
- Pan troglodytes*

# Genome Sizes

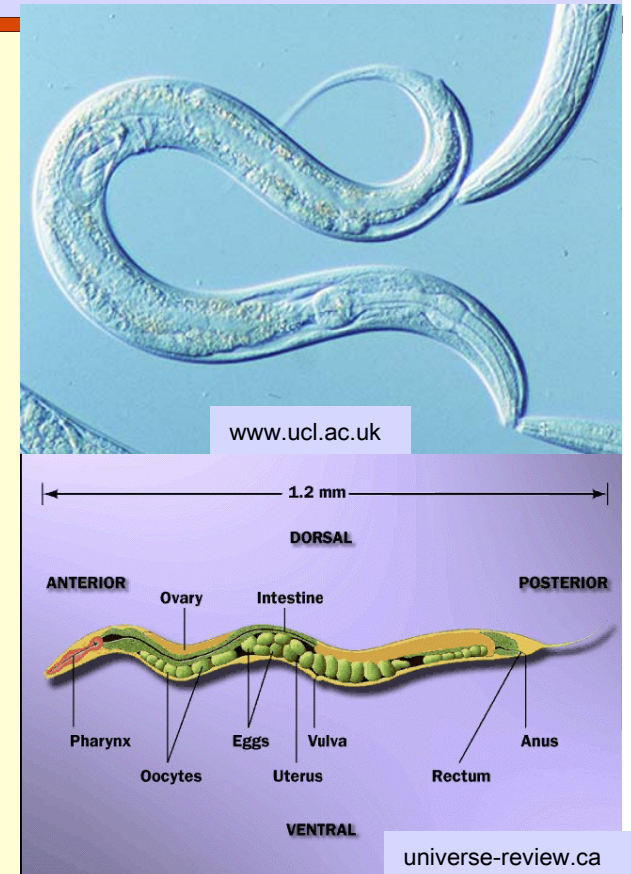

Organism	Size	Date	Est. # genes
<i>HIV type 1</i>	9.2 Kb	1997	9
<i>H. influenzae</i>	1.8 Mb	1995	1,740
<i>M. genitalium</i>	0.58 Mb	1998	525
<i>E. coli</i>	4.7 Mb	1997	4,000
<i>S. cerevisiae</i>	12.1 Mb	1996	6,034
<i>C. elegans</i>	97 Mb	1998	19,099
<i>A. thaliana</i>	100 Mb	2000	25,000
<i>D. melanogaster</i>	180 Mb	2000	13,061
<i>M. musculus</i>	3 Gb	2002	~30,000
<i>H. sapiens</i>	3 Gb	2001	32,000+

# Short Homework 1

- List the most recent organism to be sequenced from each of the following categories. List the date they were sequenced and their genome sizes. When possible also list their common names.
  - Mammal
  - Land plant
  - Insect
  - Fish
  - Reptile
  - Bird
- Name the organism with the largest sequenced genome.
- Name the organism with the shortest sequenced genome.

# Caenorhabditis Elegans

- ❑ Entire genome - 1998; 8 year effort
- ❑ 1<sup>st</sup> animal; 2<sup>nd</sup> eukaryote (after yeast)
- ❑ Nematode (phylum)
- ❑ Easy to experiment with; Easily observable
- ❑ 97 million bases; 20,000 genes;
- ❑ 12,000 with known function; 6 Chromosomes;
- ❑ GC content 36%
- ❑ 959 cells; 302-cell nervous system
- ❑ 36% of proteins common with human
- ❑ 15 Kb mitochondrial genome
- ❑ Results in **ACeDB**
- ❑ 25% of genes in operons
- ❑ Important for HGP: technology, software, scale/efficiency
- ❑ 182 genes with alternative splice variants

# Homo sapiens

- ❑ Sequenced - 2001; 15 year effort
- ❑ 3 billion bases, 500 gaps
- ❑ Variable density of **Genes, SNPs, CpG islands**
- ❑ ~ 1.1% of genome codes for proteins; **99%?**
- ❑ ~ 40-48% of the genome consists of repeat sequences
- ❑ ~ 10 % of the genome consists of repeats called ALUs
- ❑ ~ 5 % of the genome consists of long repeats (>1 Kb)
- ❑ 223 genes common with bacteria that are missing from worm, fly or yeast.

# Patterns in Protein Structures

# Microarray Analysis

Different patterns of gene expression of oral epithelial IHGK cells upon co-culture with *A. actinomycetemcomitans* or *P. gingivalis*.

# Tools: GenePlot

1491 proteins total

Comparison of proteins from two strains of *Helicobacter Pylori*, 26695 and J99. Each point represents a pair of proteins from the two organisms showing a symmetrical best BLAST score; the coordinates of each point correspond to the position of the protein genes in the 2 genomes. Note the juxtaposition and inversion of two segments of the genome between the two strains.

# SIDS

- ❑ 18000 Amish people in Pennsylvania
- ❑ Mostly intermarried due to religious doctrine
- ❑ rare recessive diseases occurred with high frequencies.
- ❑ SIDS: 3000 deaths/year (US); 21 deaths (Amish community)
- ❑ Many research centers failed to identify cause
- ❑ Collaboration between Affymetrix, TGEN & Clinic for special children solved the problem in 2 months
- ❑ Studied 10000 SNPs using microarray technology
- ❑ Their experiments showed that all the sick infants had two mutant copies of a specific gene, and their parents were carriers of the mutant gene.
- ❑ Conclusion: **Disease caused by 2 abnormal copies of TSPYL gene**
- ❑ Identified genes expressed in key organs (brainstem, testes)
- ❑ [http://www.affymetrix.com/community/wayahead/modern\\_miracle.affx](http://www.affymetrix.com/community/wayahead/modern_miracle.affx)

## 2 star molecular players

**Figure S.21** Schematic diagram of the subunit structure of hemagglutinin from influenza virus. The structure comprises about 550 amino acids arranged in two chains HA<sub>1</sub> (red) and HA<sub>2</sub> (blue). The first half of each chain has a lighter color in the diagram. The subunit is very elongated with a long stemlike region built up by residues from both chains and includes one of the longest  $\alpha$  helices known in a globular structure, about 75Å long. The globular head is formed by residues only from HA<sub>1</sub>. (Courtesy of Don Wiley, Harvard University.)

# The Polymeric Players

# DNA

## Complementary Bases

# Proteins – Amino acids

amino acid	3 letter code	1 letter code
alanine	Ala	A
arginine	Arg	R
aspartic acid	Asp	D
asparagine	Asn	N
cysteine	Cys	C
glutamic acid	Glu	E
glutamine	Gln	Q
glycine	Gly	G
histine	His	H
isoleucine	Ile	I
leucine	Leu	L
lysine	Lys	K
methionine	Met	M
phenylalanine	Phe	F
proline	Pro	P
serine	Ser	S
threonine	Thr	T
tryptophan	Trp	W
tyrosine	Tyr	Y
valine	Val	V

Table 1.1: *Amino acid abbreviations*

# RNA

# Genes

DNA

  
DNA → RNA → Protein

# Basic Genetic Processes

**Figure 6-1 The basic genetic processes.** The processes shown here are thought to occur in all present-day cells. Very early in the evolution of life, however, much simpler cells probably existed that lacked both DNA and proteins (see Figure 1-11). Note that a sequence of three nucleotides (a codon) in an RNA molecule codes for a specific amino acid in a protein.

# The Genetic Code

		2nd base in codon				
		U	C	A	G	
1st base in codon	U	Phe Phe Leu Leu	Ser Ser Ser Ser	Tyr Tyr STOP STOP	Cys Cys STOP Trp	U C A G
	C	Leu Leu Leu Leu	Pro Pro Pro Pro	His His Gln Gln	Arg Arg Arg Arg	U C A G
	A	Ile Ile Ile Met	Thr Thr Thr Thr	Asn Asn Lys Lys	Ser Ser Arg Arg	U C A G
	G	Val Val Val Val	Ala Ala Ala Ala	Asp Asp Glu Glu	Gly Gly Gly Gly	U C A G
						3rd base in codon
