### Network Flow

- **Directed graph**  $G(V,E)$  with **capacity function** on edges given by non-negative function  $c: E(G) \rightarrow \mathbb{R}^+$ .
  - Capacity of each edge,  $e$ , is given by  $c(e)$
  - Source vertex  $s$
  - Sink vertex  $t$
- **Flow function**  $f$  is a non-negative function of the edges
  - $f: E(G) \rightarrow \mathbb{R}^+$
  - **Capacity constraints:**  $f(e) \leq c(e)$
  - **Flow conservation constraints:** For all vertices except source and sink, sum of flow values along edges **entering** a vertex equals sum of flow values along edges **leaving** that vertex
- **Flow value:** sum of flow values from **source** vertex (or sum of flow into **sink** vertex)

---

---

---

---

---

---

---

---

### Flow Conservation

- For any legal flow function:
  - Flow out of source = Flow into sink (*Why?*)

2/4/10 COT 6936 5

---

---

---

---

---

---

---

---

### Network Flow: How to increase flow

Find path with **residual capacity** and increase flow along path.

- Path  $s$  to  $v_1$  to  $v_3$  to  $t$  has no residual capacity
  - edge  $v_1$  to  $v_3$  is saturated
- Path  $s$  to  $v_2$  to  $v_3$  to  $t$  has residual capacity

2/4/10 COT 6936 6

---

---

---

---

---

---

---

---

### Residual Flows and Augmenting Paths

Flow = 19

Flow = 23

Capacity of augmenting path = 4

2/4/10 COT 6936 7

---

---

---

---

---

---

---

---

### Residual Flow Network: Definition

- Directed Graph  $G(V,E)$  with capacity function  $c$  and flow function  $f$
- Residual flow network  $G_f(V,E')$ 
  - For every edge  $e = (u,v)$  in  $E$  with  $f(e) < c(e)$ , there are two edges in  $E'$ :  $(u,v)$  and  $(v,u)$  with capacities  $c(e) - f(e)$  and  $f(e)$ , respectively
  - For every edge  $e = (u,v)$  in  $E$  with  $f(e) = c(e)$ , there is one edge in  $E'$ :  $(v,u)$  with capacity  $f(e)$
  - For every edge  $e = (u,v)$  in  $E$  with  $f(e) = 0$ , there is one edge in  $E'$ :  $(u,v)$  with capacity  $f(e)$

---

### Ford Fulkerson Algorithm

- Initialize flow  $f$  to 0.
- While (there exists augmenting path  $p$  from  $s$  to  $t$ ) do
  - Augment flow along augmenting path  $p$
- Return flow  $f$  as maximum flow from  $s$  to  $t$

---

---

---

---

---

---

---

---

### Ford Fulkerson Algorithm

- Initialize flow  $f$  to 0.
- While (there exists directed path  $p$  from  $s$  to  $t$  in residual flow network  $G_f$ ) do
  - Augment flow along augmenting path  $p$
- Return flow  $f$  as maximum flow from  $s$  to  $t$

### Ford-Fulkerson Method: Example

### Correctness of Ford-Fulkerson Method

## Time Complexity

- It can be arbitrarily large.

- **Solution:** When finding augmenting path, find the shortest path
- In that case, time complexity =  $O(mn)$
