Program COP2250pgm3d, covering Multidimensional and Parallel Arrays, 
swap, endless while loop, %,

1 - Worth 1 point
  Passing 3 numbers call a method that will print these numbers in ascending order, 
    e.i. if you pass (98, 234, 6) 
    print 6 98 234 
  You must make a method called "swap", do NOT use any built-in sort

2 - Worth 2 points 
  Using a while( true ) loop, print the upper case alphabet and its corresponding ascii values, from Z to A 
  Note: You must terminate/exit/break this loop once you process the last letter (A)

3 - Worth 2 points
  - Create a two dimensional array of 10 rows by 10 columns 
  - Load each index with the multiplication of its x and y location 
  - Add all the values in columns 3, 5, and 7, and print the total 
  - Add all the values in rows 2, 4, and 6, and print the total 
  - Subtract the total values (rows-columns), and print the difference.

4 - Worth 2 points
  Implement division by 0, with error trapping, using if and while() commands, 
  make sure to use "casting" e.i. float result = (float)int/int; 
  How: Using a while loop, read 2 numbers from the user. 
  Using the if statement, test that the second number in not zero, if it is inform 
    the user of the error, and ask for a correct second number. 
  if the second number is NOT a zero, do the division, display all numbers and the 
  computation using labels, the result MUST have 2 decimal places, 
    e.i. "The first number 10 divided by the second number 5 is 2.00" 
  To exit the while loop the user must enter the value 999 for the first or the second number.

5 - Worth 1 point 
  Using the loop of your choice display all numbers from 0 to 100 where "mod 5 = 3". Hint: %

6 - Worth 2 points
  Having the following TWO, ONE dimension arrays: 
    one[0] = "This ANSI C "; two[0] = "class";
    one[1] = "at ";  two[1] = "FIU";
    one[2] = "is ";  two[2] = "challenging && enjoyable";
  print the results in a parallel array format made with these two one dim arrays
